

5250 Screen Capture Includes Automatic Identification & Extraction of Business-Items (Customer, Item, Account...) *Solution increases auditability & compliance of applications*

Nanuet, New York – May 2, 2014 - [Raz-Lee Security](#), a leading supplier of information security solutions for the IBM i, has announced the availability of Capture with Business-Items (CBI), an extension of its extremely successful [Capture product](#). Extracting of Business-Items such as Customer, Item, Account, etc., from Capture 5250 screens provides auditors and application managers advanced tools for ensuring application functionality.

An example of CBI's immediate relevance is its ability to fulfill the requirements of Italian banks resulting from a new Italian Privacy Law, effective June 2014, which specifically requires screen capturing with Business-Item extraction. The Italian IBM i market is known to be the second largest in the world, after the United States, numbering many tens of thousands of systems.

CBI's market-unique focus on Business-Items is Raz-Lee's second implementation of this approach; [AP-Journal](#), which monitors changes and accesses to data and sends real-time alerts when pre-defined field thresholds have been exceeded, also focuses on Business-Items in order to integrate data from numerous files into a single, integrated, data record directly related to the specific Business Item. This allows tracking the full history of a subject, by all its aspects in a chronological order, with instantaneous results.

Following are some of CBI's major features:

- **Rule based, Auto start** of screen capturing
- **Capture screens** with relevant information such as Job details, Display file and record format names, Program that displayed the screen (including the statement number), Library list, Current user, etc.
- **System Aided** identification of Business-Items as display file's fields
- **Automatic extraction** of Business-Items from user screens taking into account possible changes in screen positioning
- **Auto repair** of display file's field positions after display file has been modified
- **Auto identification of run environment** such as Test/Production, Branch Id...
- **Search, Playback, Print, E-mail as HTML** and additional capabilities to audit organization's activity
- Performance impact is virtually zero. Screen data requires modest disk space.

“Over the years, Raz-Lee has always answered market demands quickly and with highly professional solutions; as such, we are now extremely happy to be servicing our current and future Capture customers, as well as Italian customers & prospects, with CBI”, said Shmuel Zailer, CEO/CTO, Raz-Lee Security. “In announcing this support, Raz-Lee is again the first IBM i security, auditing and compliance ISV to prove its technological competence and flexibility by implementing market and customer-driven requirements into its software products.”

About Raz-Lee Security Inc. and [iSecurity](#)

Raz-Lee Security, headquartered in Nanuet, New York, is the leading security solution provider for IBM's IBM i (AS/400) computers. Drawing upon its more than 30 years of expertise in the IBM i Performance and Optimization market, the company designs, develops and markets a comprehensive suite of advanced security software solutions - iSecurity.

Raz-Lee's iSecurity product suite is field-proven at thousands of sites, ranging from sites with more than 175 systems thru SMBs and single-LPAR P05 installations, in more than 40 countries worldwide.
