

iSecurity Compliance Suite Released

User Profiles, Native Objects, IFS Objects “Plan, Check, Set” with Scorecard and Multi-LPAR comparison

Nanuet, New York – January 20, 2015 - [Raz-Lee Security](http://www.razlee.com), a leading developer of security, auditing & compliance solutions for the IBM i (AS/400), has announced the availability of iSecurity Compliance Suite.

iSecurity Compliance Suite includes several components with a common workflow and methodology, as well as Compliance Evaluator which has been successfully marketed and sold to large companies striving to attain compliance, to prove to auditors that they are indeed compliant to predefined compliance templates and to retain, over time, corporate compliance policies.

The User Profile, Native Object Security and IFS Object Security components of Compliance Optimization all present the user with the following possibilities:

1. **Advise.** As an optional first step, the user can invoke a wizard which, by use of Artificial Intelligence, reviews existing items and classifies them automatically into generic templates. This unique feature eases the compliance starting point and provides the answer to “How should I set up my template?”
2. **Plan** the security aspects of protecting the components via automatically generated templates encompassing as many individual entities as possible
3. **Check** that the planned security aspects comply to the corporate compliance policies as defined by the corresponding templates and, via exception reports, discover any items which do not comply with the defined templates.
4. **Set** the security related attributes to their appropriate values as defined by the corresponding template. Product output can be directed to PDF, HTML, CSV and Output files.

Compliance Evaluator covers all other compliance-related aspects. It offers “ready-to-run” compliance checklists for PCI, SOX, HIPAA, FDA and other regulations. The checklists, which can be modified to adhere to site-specific requirements, provide managers and system administrators with a color-coded Excel spreadsheet, which can be displayed in both summary and detailed formats.

“Raz-Lee has always strived to answer to market demands quickly and with highly professional solutions; with compliance awareness growing at a steady pace and with auditor’s increasing demands for monitoring and reporting solutions, the iSecurity Suite is an ideal solution as it covers all of the most relevant areas of the IBM i (AS/400): user profiles, native objects and IFS objects”, said Shmuel Zailer, CEO/CTO, Raz-Lee Security. “With Compliance Suite, Raz-Lee once again proves its technological capabilities and flexibility by implementing market and customer-driven requirements into its software products.”

About Raz-Lee Security Inc. and [iSecurity](#)

Raz-Lee Security, headquartered in Nanuet, New York, is the leading security solution provider for IBM's IBM i (AS/400) computers. Drawing upon its more than 30 years of expertise in the IBM i Performance and Optimization market, the company designs, develops and markets a comprehensive suite of advanced security software solutions - iSecurity.

Raz-Lee's iSecurity product suite is field-proven at thousands of sites, ranging from sites with more than 175 systems thru SMBs and single-LPAR P05 installations, in more than 40 countries worldwide.
