

Raz-Lee's iSecurity Solutions Self-Audit Changes Made to Product Definition Files

Nanuet, New York – October 8, 2015 - Raz-Lee Security Inc., a major vendor of security, auditing and compliance software solutions for IBM i systems, announces the availability of self-auditing features for monitoring and logging all changes made to product configuration and definition files in all its [iSecurity products](#).

This market-unique feature addresses a potentially serious security exposure, based on the well-known 'who polices the police' scenario; that is, a system administrator with open and unrecorded access to a security product may freely change the product's definitions to allow abusing the system without such breaches being detected by others, even by those who are be administrating the product.

Auditors especially have traditionally been concerned and rightfully challenged by the task of auditing activities of system administrators to ensure they work within corporate standards and industry best practices. The new iSecurity features which monitor and log all changes made to individual iSecurity product configuration files provide auditors with the solution they require!

In response to iSecurity user's requests from companies worldwide, Raz-Lee has decided to offer free self-auditing for all its products, providing auditors with the maximum confidence that changes made to iSecurity's product definitions are indeed being audited and not circumvented.

"Auditors at large customers worldwide have asked Raz-Lee for some time to provide the capability to audit its own product's definition changes; Raz-Lee has now decided to provide exactly what customers are looking for, a free, robust and out-of-the-box product feature" said Eli Spitz, VP of Business Development at Raz-Lee Security. "Raz-Lee has once again answered the requests of its worldwide customer base and remains in the forefront of IBM i technology."

About Raz-Lee Security Inc. and iSecurity

Raz-Lee Security, headquartered in Nanuet, New York, is the leading security solution provider for IBM's IBM i (AS/400) computers. Drawing upon its more than 32 years of expertise in the IBM i Performance and Optimization market, the company designs, develops and markets a comprehensive suite of advanced security software solutions - iSecurity.

Raz-Lee's iSecurity product suite is field-proven at thousands of sites, ranging from sites with more than 200 systems thru SMBs and single-LPAR P05 installations, in more than 40 countries worldwide.
