

## **Raz-Lee Offers Advanced File Editor with Full Unicode – FREE!**

**Herzliya, Israel** – April 29, 2010 - [Raz-Lee Security](#), a major world-wide vendor of security solutions for IBM Power i computers, has enhanced its feature-rich SOX and PCI compliant file editor, FileScope, with full Unicode (UTF-16, UCS-2) support, to comply with the prevalent international standard. Unicode support is totally unique in the Power i data manipulation market and encompasses ALL FileScope facilities including Substring, Scan and Subset functions.

Unicode, a fundamental building block for international e-business, allows data from many different languages to be stored in one repository. Today's business world demands that IT systems be able to present content and conduct transactions in all major worldwide languages. Unicode enables a single set of application source code to be written to process data in any language. It also makes the addition of new language support to an existing e-business application relatively simple since character processing and storage remains unchanged. This results in lower costs of implementation, faster time to market, and higher customer satisfaction.

FileScope is packaged in both Gold and Platinum versions, both of which support the new Unicode capability. While technologically similar, the Platinum version supports more SOX, PCI, auditing and file journaling capabilities, making it more appropriate for large and mid-sized shops.

**As part of the announcement, Raz-Lee will provide, for a limited time, FileScope/Gold with Unicode Support at \$0(!) including free maintenance for up to three months.**

FileScope's Unicode support enables viewing SAP, JDE, MOVEX, BPCS, and other files. The following functions are supported for these and similar files:

- Display file contents
- Print file contents
- Update records (single record, full screen, global changes)
- Scan for fields
- Subset records (OPNQRYP) including all Tests such as EQ....LIKE
- Substring field values
- Undo changes (up to 99 days)

Raz-Lee also offers FileScope Platinum, an upgraded version, which includes (in addition to the Gold Edition features):

- Improved SOX/PCI support
  - SYSLOG/SNMP Messages for SIEM – transmits up to 1000 lines per second.
  - User Activity List Email – including users, times and actions.
- XML support
- Report Generator
- Full Screen Update

"A Unicode-supporting file editor is a highly desirable product, unrivaled by any other company, and we've already witnessed the demand for it" said Shmuel Zailer, CEO, Raz-Lee Security. "It is a fitting enhancement for our FileScope product, which is already well-stocked with unique features such as Undo, Join and User activity list emails – also unique to Raz-Lee's technology."

**About Raz-Lee Security Inc. and FileScope**

Raz-Lee Security, with headquarters in Nanuet, New York, is a leading security solution provider for IBM's Power i (AS/400) computers. Drawing upon its 26 years of expertise in the Power i Performance and Optimization market, the company designs, develops, and markets a comprehensive suite of advanced Power i solutions. Raz-Lee's products are field-proven and has been successfully implemented in over 30 countries.

FileScope is a leading data manipulation product for Power i (iSeries or AS/400), providing advanced file editing capabilities.

FileScope's powerful tools enable users to quickly and easily use both basic and advanced functions such as view, scan, print, global and local record updates, performing data conversion and creating test data. The product offers an easy-to-use user interface, with no programming required.
