

Full iSecurity Solution for Multi-System/Multi-LPAR Environments

Herzliya, Israel – May 5, 2010 - [Raz-Lee Security](#), a major vendor of security solutions for IBM Power i computers, has developed a comprehensive solution for Multi-System/Multi-LPAR environments, in response to the trends to “downsize” and consolidate servers.

As the number of special-purpose systems and LPARs at enterprises worldwide grows, it is critical that user profile definitions including passwords as well as system values are synchronized between the different Power i systems, allowing for exceptions as needed in Production, Test or Development environments. Naturally, synchronization must entail minimum overhead to both systems and the personnel mandated with managing user profile information.

Raz-Lee has identified this trend and consequently tailored a full security solution for multi-system/multi-LPAR environments. The solution, integrated in the [iSecurity](#) product suite, includes:

- [Replication](#) – duplicates user profiles including passwords and other user profile definitions, as well as system values, from one system/LPAR to another, and synchronizes all parameters such as user authorities in all systems.
- [Compliance Evaluator](#) - compares compliance of different systems/LPARs
- [Centralized Reporting](#) – references and collects data from several systems/LPARs and creates reports in "merged" or individual format
- [SYSLOG](#) – the ability to interface with all leading SEM (Security Event Management) products is supported by iSecurity
- [Central Administration](#) – exports and imports product definitions & logs between different systems

"In order to uphold our status as a top-notch Power i security provider, we make it our business to identify relevant market trends and provide our customers with the exact solutions they are looking for," said Eli Spitz, VP Business Development, Raz-Lee Security. "No other company has our abundance of features for Multi-System/Multi-LPAR environments, which is yet another unique feature for our iSecurity solution."

About Raz-Lee Security Inc. and iSecurity

Raz-Lee Security, with headquarters in Nanuet, New York, is a leading security solution provider for IBM's Power i (AS/400) computers. Drawing upon its 26 years of expertise in

the Power i Performance and Optimization market, the company designs, develops, and markets a comprehensive suite of advanced security software solutions—iSecurity.

Raz-Lee's iSecurity product suite is field-proven and has been successfully implemented in over 30 countries. iSecurity features three product sets: the Prevention pack, a complete security solution covering user/password management, anti-virus protection, detection of harmful events, protection of workstations and more; the Compliance pack, which comprises auditing and compliance solutions, providing automatic reporting security related

information; and the Application Security suite, which provides information on all changes in business-critical data using real-time alerts and timeline reports.
