

Raz-Lee Introduces iTweet, Supporting Bi-Directional Messaging Between Twitter & Power i

Herzliya, Israel – April 29, 2010 - [Raz-Lee Security](#), a leading global supplier of information security & compliance solutions for the IBM Power i, has released iTweet, a product enabling instant messaging over Twitter for the Power i.

iTweet sends selected messages to relevant users through www.twitter.com. These messages are sent effortlessly and instantaneously to users. These messages include event information, message queues, alerts on changes, deletes or reads, emergency changes in user authorities, IFS viruses detected, field-level changes to data and even VIEW of pre-defined "unreadable" data object deletion.

The tool provides a bi-directional interface between Twitter and the Power i, so that users can reply from Twitter to the Power i, for example when an error/inquiry message appears. Messages can be received through PCs, cell phones or PDAs. A secure environment can be configured, ensuring that only relevant users can view them.

iTweet is available both as a standalone tool and as a feature integrated into other iSecurity products such as Audit, Authority on Demand, AP-Journal, Anti Virus and more. Security alert support via iTweet is in addition to existing support for alerts in the form of e-mails, MSGQ, SNMP messages, SYSLOG, SMS, etc.

In order to adapt to Twitter's limitation of up to 100 messages per hour, the iSecurity SYSLOG assigns security levels to each message in order to decide which messages to send.

"Twitter, a highly popular social marketing tool, is mostly used for recreational or marketing purposes. iTweet, however, utilizes its easy and immediate qualities for purely technical and functional purposes. iTweet can be a real help for System Administrators and Power i users, speed up processes and streamline knowledge flow."

About Raz-Lee Security Inc. and iSecurity

Raz-Lee Security, with headquarters in Nanuet, New York, is a leading security solution provider for IBM's Power i (AS/400) computers. Drawing upon its 26 years of expertise in the Power i Performance and Optimization market, the company designs, develops, and markets a comprehensive suite of advanced security software solutions—iSecurity.

Raz-Lee's iSecurity product suite is field-proven and has been successfully implemented in over 30 countries. iSecurity features three product sets: the Prevention pack, a complete security solution covering user/password management, anti-virus protection, detection of harmful events, protection of workstations and more; the Compliance pack, which comprises auditing and compliance solutions, providing automatic reporting security related information; and the Application Security suite, which provides information on all changes in business-critical data using real-time alerts and timeline reports.
