

**FOR IMMEDIATE RELEASE**

**Raz-Lee Security Enhances its iSecurity Product Suite  
with Unique Application Security Solutions**

*New flagship product, AP-Journal, pinpoints changes in application data  
and produces timeline reports*

**Nanuet, New York (May 1, 2008)** - Raz-Lee Security Inc., a leading vendor of security solutions for IBM System i computers, revealed its novel Application Security solutions which joined its renowned iSecurity suite of products. The Application Security solutions provide information on all changes in the business-critical data of financial, ERP, healthcare and banking enterprises, using real-time alerts and timeline reports.

Whereas current products on the market address only infrastructure security, i.e. network access (firewall), auditing and anti-virus software, solutions that handle the security requirements of an enterprise's business-critical data are scarce - despite increasing demand generated by the market, auditors and regulators. Nevertheless, Raz-Lee's pioneering approach led it to create a series of distinctive Application Security solutions responding to industry needs, based on patent-pending technology.

The flagship Application Security product, AP-Journal, generates real-time threshold-activated alerts indicating changes in business-critical data, and produces before & after change reports covering tens of years of application history. For instance, AP-Journal can send a message to an Application Manager when the interest rate changes by more than 0.5% or when a programmer's salary changes by more than \$500. Additional products in the suite are Capture, which saves a full record of all user session screens for investigative and compliance purposes, and View, which controls permissions for viewing specific field and record data.

"iSecurity's Application Security solutions respond to a growing need for both real-time and historical monitoring of activities relating to *the* most critical resource of any enterprise - its data," said Mr. Shmuel Zailer, CEO, Raz-Lee Security. "In fact, a number of IBM ISVs (independent software vendors) are in various phases of integrating our new Application Security products into their systems (as OEM), to provide their customers with standards-compliant applications."

## **About Raz-Lee Security Inc.**

Raz-Lee Security, headquartered in Nanuet, New York, is the leading security solution provider for IBM's System i (AS/400) computers. Drawing upon its 25 years of expertise in the System i Performance and Optimization market, the company designs, develops and markets a comprehensive suite of advanced security software solutions - iSecurity.

Raz-Lee's iSecurity product suite is field-proven and has been successfully implemented in over 30 countries. iSecurity features three product sets: the Prevention pack, a complete security solution covering user/password management, anti-virus protection, detection of harmful events, protection of workstations and more; the Compliance pack, which comprises auditing and compliance solutions, providing automatic reporting security related information; and the Application Security suite, provide information on all changes in the business-critical data using real-time alerts and timeline reports.
