

## **Raz-Lee's iSecurity Extends Real-Time Monitoring of System i Events**

**Nanuet, New York - 2 December, 2008** - Raz-Lee Security Inc., a major vendor of security solutions for IBM System i computers, announced that iSecurity now supports the sending of Syslog real-time notification messages to Security Information and Event Management (SIEM) servers.

Current security regulations and auditing best practices dictate that log files from network access attempts and critical system components be monitored by a real-time alert system tracking potential security failures and abnormal changes to application data. Until recently, iSecurity satisfied this requirement by sending real-time e-mail and operator message alerts and executing CL scripts when such events occurred.

However, with the increasing prevalence of site-wide Intrusion Detection and Security Information Management systems, which present managers with an end-to-end view of security related events at different network nodes, it has become increasingly important to display security-related events from the System i in the same manner.

iSecurity's new Syslog capability sends events from various System i facilities (such as logs and message systems) to a remote Syslog server, and categorizes the events according to a range of severities such as emergency, alert, critical, error, warning, notice, informational and debug.

The Syslog feature enables the system administrator to decide under which conditions the System i should send a Syslog message, to choose the IP address of the Syslog server, the facility from which the message is sent, the severity range and the recipients, as well as decide whether the Syslog message should contain all events from iSecurity Firewall or only the rejected entries.

"We are excited to add this important feature to our iSecurity product line," said Eli Spitz, VP Business Development, Raz-Lee Security. "Real-time monitoring of critical incidents enables integration of System i events with similar events occurring on other systems in the enterprise, and is vital for any organization's security. Our Syslog support provides a System i-specific event monitoring tool that is both comprehensive and convenient."
