

Application Security Suite

The Application Security Suite includes advanced solutions for protecting business-critical application databases from unauthorized access and for tracking user activities on application databases. Application Security solutions enable the user to control who accesses which fields and records in corporate databases, and investigate every change performed to any database field over an indefinite period of time.

In addition to airtight database security, the Application Security suite provides compliance with regulatory and audit requirements applicable to the financial, healthcare, and other regulated industries.

The Application Security Suite keeps managers constantly and thoroughly informed about their application databases. Any change which crosses a user-defined threshold triggers an alert, and all the changes to a certain field can be gathered into a single timeline report. In addition, the Application Security Suite saves screen captures and enables searching for specific sessions for incriminating evidence and playback of user sessions.

The suite complements high-availability products by ensuring full journal receiver synchronization, and solidifies the position of iSecurity™ as the most comprehensive security solution for System i environments.
