

The Challenge

Obtaining a full audit trail of user's activities by capturing 5250 screen images and searching them for a specific string or occurrence is increasingly important as:

- More and more non-corporate personnel-auditors, consultants, software vendors-work on-site or remote
- Help desk and support personnel are increasingly being contacted to answer application workflow issues
- Disgruntled employees easily find ways to perform malicious activities
- Stringent compliance and user activity audit requirements are being imposed by regulatory authorities worldwide

Working with Capture

Capture works both as a stand-alone product and as a fully integrated module with other iSecurity products. For example, Capture can be invoked when additional user authority is granted in emergency situations, to automatically log user activity during this period.

Capture can be activated by predefined, selectable criteria to provide an incontestable audit trail of potentially suspicious user behavior.

Capture is integrated at data centers worldwide in banking, insurance, healthcare, gaming, manufacturing and other key industries.

The Capture Solution

Capture is part of the full-featured iSecurity suite, and provides much more than just computer logs and audit reports; Capture incorporates the following functionalities:

- Records and retains user screen activity
- Easy navigation through recorded sessions
- Playback screen recordings
- Define rules for selective recording by user-selectable criteria
- Identifies business items which were displayed
- Assists in complying with regulatory compliance standards
- Can operate silently, without user knowledge, or can notify users that their session is being recorded
- Collects and documents CL (Command Logs)
- No performance degradation, minimal storage required
- Integrated with other iSecurity solutions
- Supplements other audit measures with incontestable evidence
- Installs quickly, is non-invasive and risk-free.

In summary, recording user screen activity provides undisputable forensic evidence that can help to quickly confirm and support what has happened on your system.
